EXPERIMENT 06

Automating Business Processes Using Deluge Scripting and Workflows, with Application Testing and Debugging

Patient Appointment Booking Form — Workflow Automation Use Case

PRANAV SRINIVAS

1. Aim

To automate a key business process of the Patient Appointment Booking application — sending an appointment confirmation email the moment a patient submits the Patient Appointment Booking Form — using a Zoho Creator workflow and a Deluge script, and to test and debug the automation with real form submissions.

This removes the need for front-desk staff to manually notify every patient, ensuring each submitted appointment request is acknowledged immediately and consistently.

2. Procedure

Step 1: Start a new workflow — From the application's Workflow section, a new workflow was created on the Patient Appointment Booking Form.

Step 2: Define the trigger — The Record Event was set to Created and the Form Event (When to trigger workflow) was set to Successful form submission, so the automation fires only after a valid, saved submission.

Step 3: Name the workflow — The workflow was named Send Appointment Confirmation and saved using Create Workflow.

Step 4: Add a new action — In the Add New Action dialog, Run this action was left on Always, and Deluge script was chosen as the Action type so custom logic could compose and send the email.

Step 5: Write the Deluge script — A sendmail script was written in the Deluge editor: it sets from to zoho.adminuserid, to to input.Email, uses the Subject “Appointment Confirmed”, and builds a message that greets the patient using input.Patient_Name and confirms the appointment.

Step 6: Save and review the action — The script was saved with Update, and the workflow summary confirmed the single Deluge script action was attached under Patient Appointment Booking Form › Created › Successful form submission › Send Appointment Confirmation, set to Execute without condition.

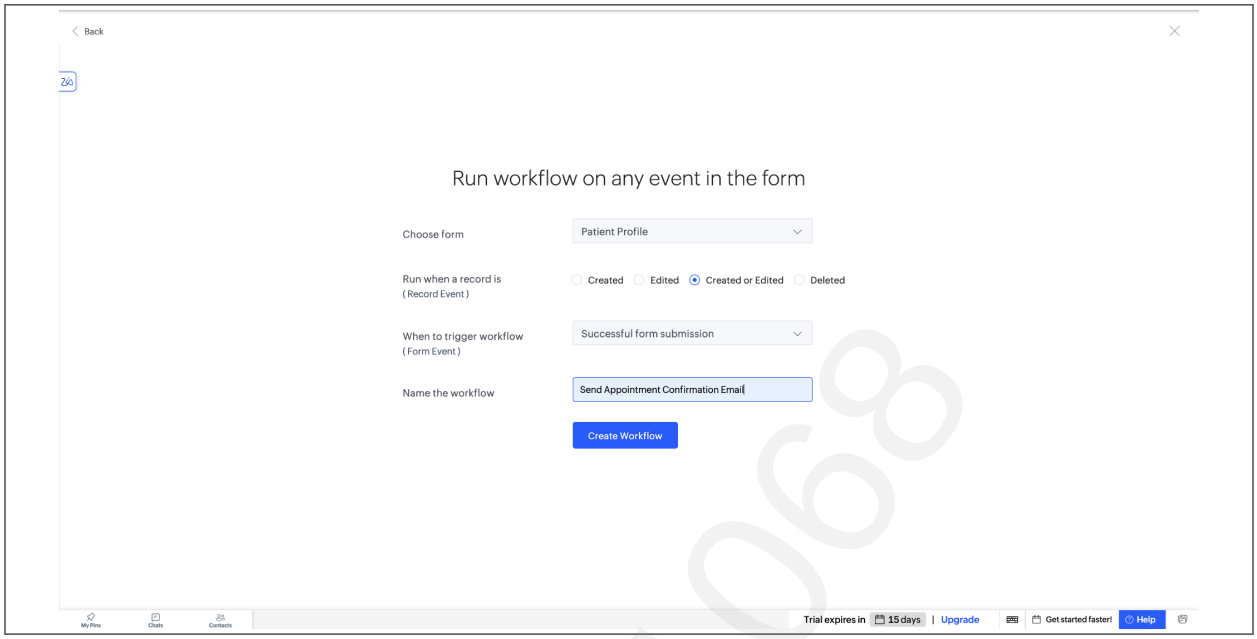

Step 7: Test with a live submission — A new record was filled in through the live Patient Appointment Booking Form, with a valid email address, and submitted to trigger the workflow.

Step 8: Debug and verify the output — While testing, the editor reported “variable not defined” errors because some field link names used in the script did not match the form, and an “Improper Statement” error when placeholder text was left in the code. The script was corrected to use the form's actual link names (Email and Patient_Name), saved, and the form was submitted again to check that the confirmation email is delivered.

3. Output

3.1 Creating the workflow — trigger configuration

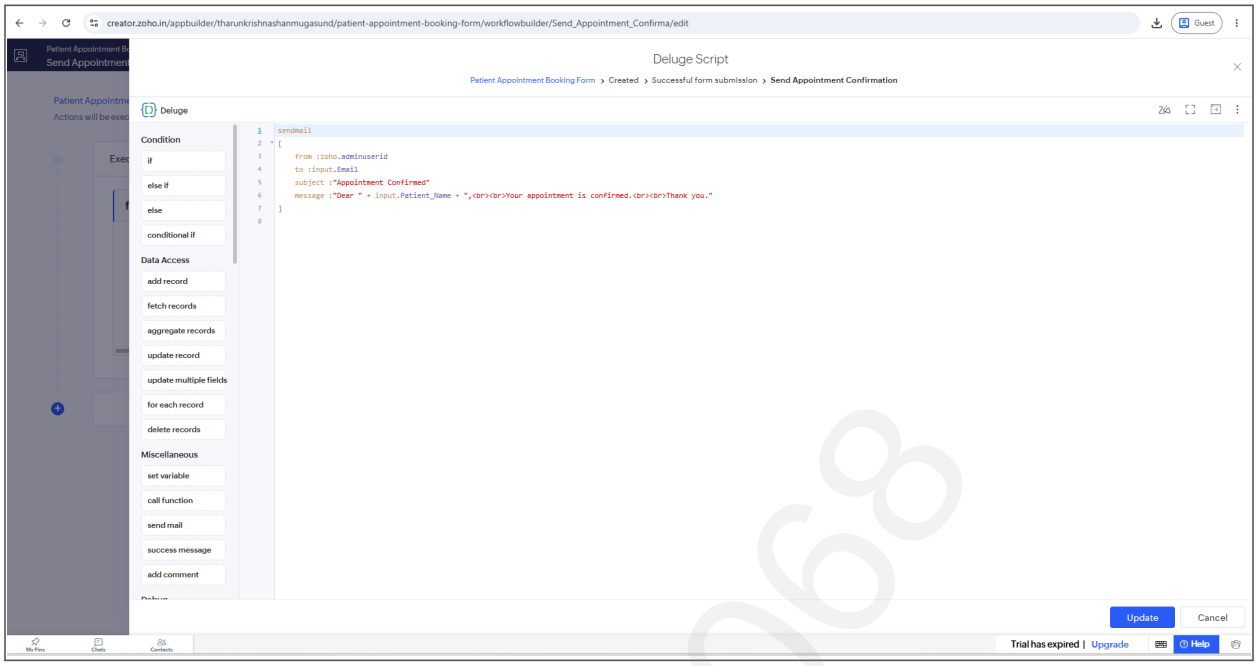

The new-workflow screen is where the form, the Record Event, the Form Event and the workflow name are chosen. This defines exactly when the automation should run.

3.2 Choosing the action type

The Add New Action dialog lists the four available action types — Notification, Data access, Integrations, and Deluge script. Deluge script is selected here because the confirmation message needs dynamic, field-driven content that a simple notification template cannot build.

3.3 Writing the Deluge script

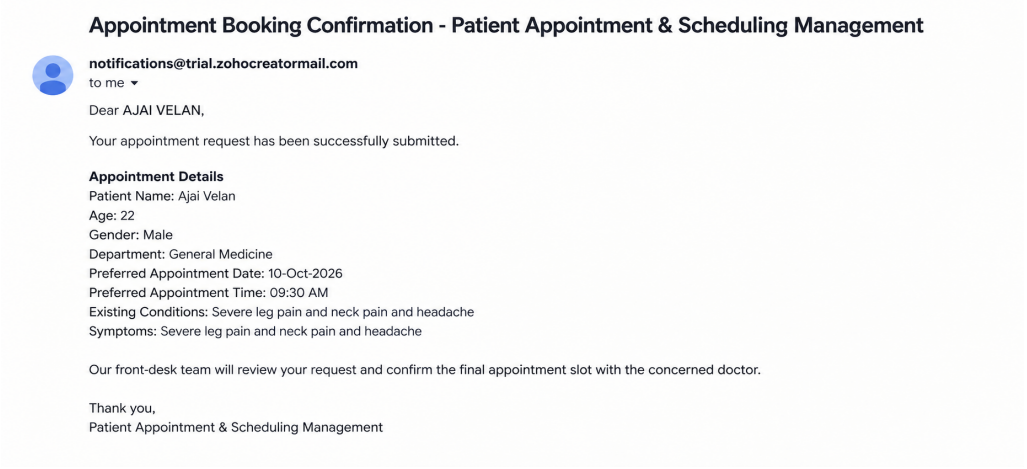

The Deluge editor shows the completed sendmail script, with the Condition, Data Access, and Miscellaneous action palette on the left for reference. The script reads input.Email and input.Patient_Name to build the recipient and the message dynamically.

3.4 Saved workflow action — summary view

After saving, the workflow summary shows the Deluge script action under Execute without condition, with the sendmail script saved. This view is also where a new action could be chained in if more automation were needed.

3.5 Debugging output — confirmation email received

Appointment Booking Confirmation - Patient Appointment & Scheduling Management

to me

Dear AJAI VELAN,

Your appointment request has been successfully submitted.

Appointment Details
Patient Name: Ajai Velan
Age: 22
Gender: Male
Department: General Medicine
Preferred Appointment Date: 10-Oct-2026
Preferred Appointment Time: 09:30 AM
Existing Conditions: Severe leg pain and neck pain and headache
Symptoms: Severe leg pain and neck pain and headache

Our front-desk team will review your request and confirm the final appointment slot with the concerned doctor.

Thank you,
Patient Appointment & Scheduling Management

inbox]

The confirmation email received after the submission shows the subject and the greeting with the patient's name pulled from the submitted record, verifying the workflow end-to-end.

4. Final Result

A complete workflow was built on the Patient Appointment Booking Form that fires automatically on successful submission, using a Deluge sendmail script to send a confirmation email to the patient with no manual intervention from the front desk.

The automation was tested with a live form submission and debugged by correcting the field link names and syntax problems reported by the Deluge editor, after which the script saved without errors.

The exercise met its objective: a real business process — notifying patients that their appointment request was received — is now automated through low-code workflow and Deluge scripting.
